# talaria

Stripe for Portaldot, with a refund button. Crypto payments for people and AI agents.

Maris · Portaldot Hacker House 2026 · Multi-Chain & Cross-Chain Infra · Testnet only

The problem

# Payments treat a stranger and a trusted merchant the same

## No middle ground

Money either moves at once with no recourse, or moves slowly for everyone.

## Stuck reputation

A track record stays on the chain where it was earned, and payments elsewhere can’t use it.

## Agents with keys

AI agents need limits that grow with their history, not an owner’s whole key.

The idea

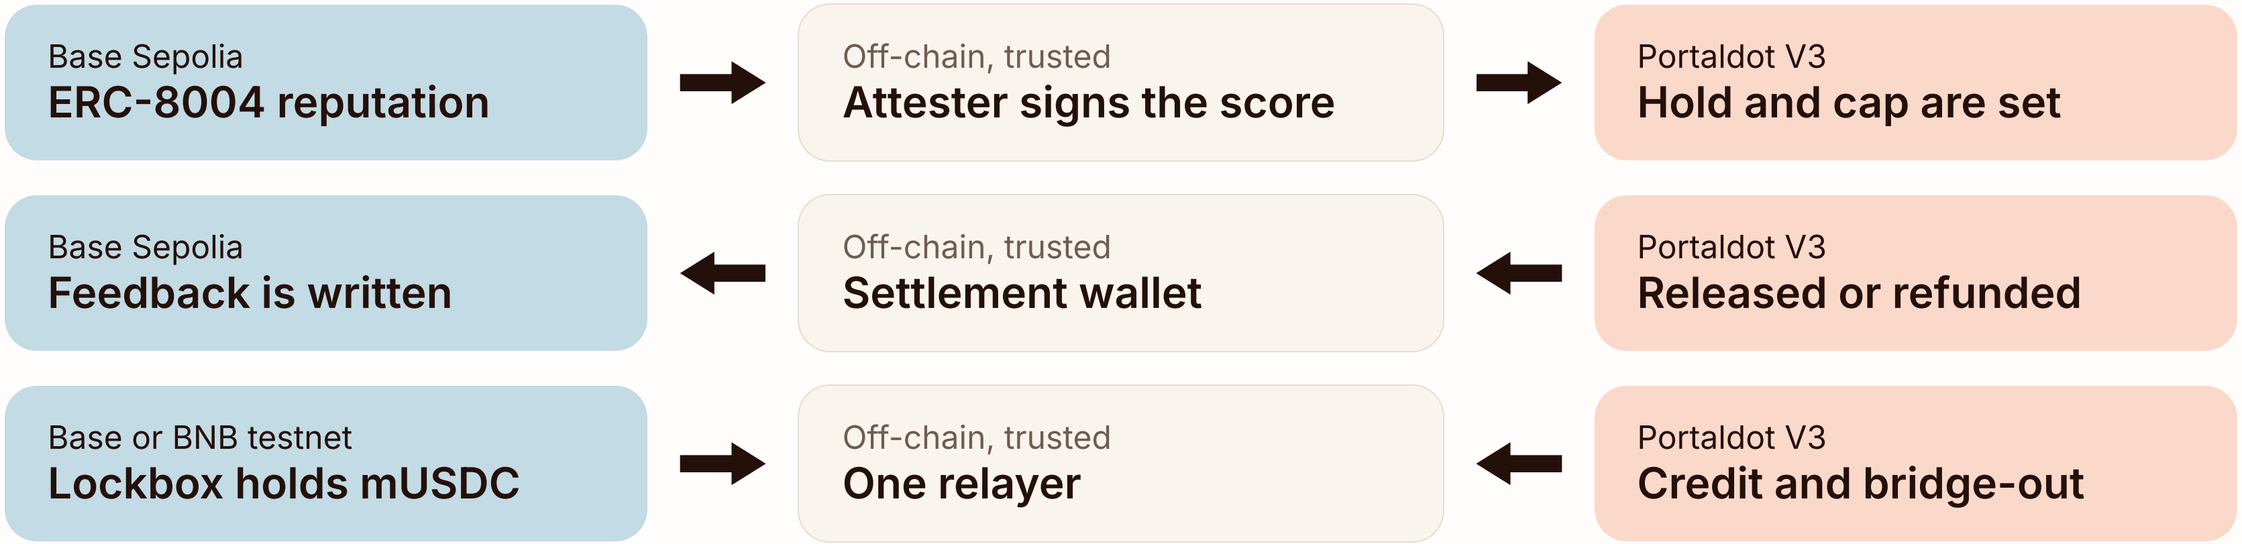

# Reputation sets the hold on a payment and the cap on an agent

| Trust tier | Merchant’s payment hold | Agent’s cap per payment |
|---|---|---|
| Trusted: score 80+, 3+ feedbacks | Instant | 100 tUSD |
| Established: score 50–79 | 10 minutes | 25 tUSD |
| New or low: under 50, or unknown | 30 minutes | 5 tUSD |

Buyers can dispute while a payment is held. Every settled outcome writes feedback back, so the score reflects what really happened.

How it works

# Reputation and money cross in both directions

Proof it works

# The full flow, live across testnets

| Step | Chain | Transaction |
|---|---|---|
| Agent buys from New Shop: held 30 min | Portaldot | 0x5f2abd21…073e |
| Buyer disputes | Portaldot | 0x803e7478…161b |
| Arbiter refunds in full | Portaldot | 0x775a18c5…1047 |
| Refund bridges out | Portaldot | 0xcb378549…70b9 |
| Refund released to the buyer | Base Sepolia | 0x4e5b8ba1…879d |
| Negative feedback for New Shop | Base Sepolia | 0x6b36aac7…a61e |
| Agent buys from Trusted Coffee: instant | Portaldot | 0xff4f51b9…b10a |
| Positive feedback for Trusted Coffee | Base Sepolia | 0xa937c932…5e4f |
| Lock on BNB testnet, credited on Portaldot | Portaldot | 0x34f3eb5c…b0b8 |

Real activity so far

# Counted from our own records

**14**

contracts: 4 on Portaldot, 8 on Base Sepolia, 2 on BNB testnet

**105**

transactions recorded, with hashes

**11**

feedback records written to Base

**6**

protected payments on Portaldot, 5 released

**1**

dispute opened and resolved by the arbiter

**3**

subjects registered in ERC-8004

Why Portaldot is essential

# Portaldot is where value and reputation settle

## V3 runs EVM

Standard Solidity, Hardhat and viem work through pallet-revive, so builders keep their tools.

## A multi-chain hub

Funds arrive from Base and BNB testnet, and reputation from Base decides what happens here.

## Built for deposits

A new slot locks about 3.84 tPOT, so attestations stay inline, and history lives in events.

Ecosystem contribution

# Open tools other Portaldot builders can use

## TypeScript SDK

Checkout, mandates, a paywall and trust lookups, under the MIT license.

## MCP server

Lets AI agents use Talaria’s payments as tools, with no keys passed in.

## Reputation layer

Signed scores other apps could check, with portable history in ERC-8004.

## Measured V3 costs

Real deposit numbers, address tools and findings, written up in the repo.

Business

# Trust is also the pricing model

| | |
|---|---|
| **Customers** | Portaldot merchants, API sellers serving AI agents, cross-border senders, agent builders |
| **Revenue** | Checkout fee in basis points, and a protection premium that falls as reputation rises, plus paid relayer tiers and bridge fees |
| **Moat** | Reputation compounds with each settled payment, and stays portable through ERC-8004 |
| **Growth** | Hacker House teams, then Portaldot merchants, then agent builders on Base, then remittance with licensed off-ramp partners |

What to trust, and what not to

# This is a testnet build, and here are its limits

| Today | What it means |
| --- | --- |
| Single attester | One key signs reputation scores |
| Single relayer | One service runs the bridge, and it can’t forge user intents |
| Admin arbiter | One admin address decides disputes |
| Four rails on Base | Subscriptions, streaming, pay-per-call and remittance aren’t on Portaldot yet |
| No audit | Test tokens only, with no value |

Why keep supporting Talaria

# From a working testnet flow to Portaldot mainnet

## Next

- All rails deployed directly on Portaldot
- Multiple attesters and a multi-signer bridge
- Independent audit, then mainnet migration
- A reputation API, and off-ramp partners

## What we ask for

- Testnet tPOT for the remaining rails
- A technical review of the bridge
- Mainnet migration support
- An ecosystem grant
